10 Team meetings and Deadlines

10.1 Week 1

10.1.1 October 6 team meeting

The team agreed upon the core idea and goal of the game: collecting memories and use them to solve puzzles.

Discussed main game mechanics: the team is split between memories being physical objects or items that stay in an intentory of sort (or maybe a hybrid).

Discussed the way memories can be remebered and forgotten: the team is undecided between a fixed place or everywhere (this also depends on the way memories work, so that has to be decided first).

Discussed upon the idea of *levels*: the team is split between a metroidvania style, based more on exploration, and a hardcore puzzle style, based more on mechanical skill and puzzle solving.

Sketched some potential ideas for memories: meterials (like bricks), gravity, yourself (become a ghost), light, dark, time (may be used to pause the game), enemies. Sketched some more ideas like collectibles, bosses (that might unlock

memory 'slots'), 'bad' memories (debuffs forced in some cases), frail memories (they can break).

10.1.2 October 13 deadline

- Bring a prototype based on the way memories work: either them being physical objects or items in an inventory (everyone)

10.2 Week 2

10.2.1 October 13 team meeting

Prototypes from everyone have been seen or tested to discuss the game design. After playtests and discussions, the team agreed upon:

- Making levels with more screens to keep a theme (like Celeste)
- Making memories physical objects that can be stored in an inventory or dropped onto the ground
- Letting the player remember and forget everywhere
- The number of memory slots (how many memories can be held at one): the player starts with 1 or 2 and defeating bosses unlocks more slots (maximum of 5 to 7)

Due to the nature of the game, memory classes have been designed:

- Permanent: typically given at the end of a level, they are permanent upgrades (like double jump)
- Semi-permanent: they only stay with the player during a level
- Frail: they can break if the player touches some specific objects (like in Portal)

Sketched some more ideas for memories: hands (ability to grab items), weapons? (can be too violent), object properties? (maybe better to stick with the objects themselves), rubber tile/spring (forces you to bounce/jump).

Sketched ideas for bosses: forces you memories and you have to adapt; gives you 'bad' memories.

The idea of collectibles remains viable, it will be discussed later on.

Andrea Ruben has shown the team his drawings and sketches for a potential game style.

10.2.2 October 20 deadline

- Sketch levels (even on paper) to test for the viability of some specific memories. Try to test as many as possible with as many ideas as possible (everyone)
